

Homework #8 Multicomponent Distillation

By: Dr. Eric Maase of The University of
Massachusetts Lowell

1) Vaporization of Multicomponent Alcohol Mixtures

The vapor-pressure at 101.325 kPa (760 mm Hg) is available for several alcohols:

| T (°C) | Vapor Pressure (mm Hg) | | | |
|--------|------------------------|----------------|-------------------|------------------|
| | Methanol (MeOH) | Ethanol (EtOH) | n-Propanol (nPOH) | n-Butanol (nBOH) |
| 50 | 415 | 220.0 | 88.9 | 33.7 |
| 60 | 629 | 351.5 | 148.9 | 59.2 |
| 65 | 767 | 438 | 190.1 | 77.7 |
| 70 | 929 | 542 | 240.6 | 99.6 |
| 75 | 1119 | 665 | 301.9 | 131.3 |
| 80 | 1339 | 812 | 376 | 165.0 |
| 85 | 1593 | 984 | 465 | 206.1 |
| 90 | 1884 | 1185 | 571 | 225.9 |
| 100 | 2598 | 1706 | 843 | 387.6 |

An alcohol feed mixture at 101.325 kPa (760 mmHg) consisting of 30 % methanol, 20% ethanol, 15% n-propyl alcohol and 35% n-butyl alcohol is to be fed to a distillation column. Calculate the following assuming the mixture follows Raoult's Law:

- The boiling point and composition of the vapor in equilibrium.
- The dew point and composition of the liquid in equilibrium.
- The temperature and composition of both phases when 40% of the feed is vaporized in a flash distillation (single 'stage' vapor-liquid separation)

Equilibrium And Flash Distillation Calculation Validation

2) Multicomponent Alcohol Distillation

An alcohol feed mixture at 101.325kPa (760 mmHg) consisting of 30 % methanol, 20% ethanol, 15% n-propyl alcohol and 35% n-butyl alcohol is distilled so that 95% of the methanol along with a residue of 5% methanol and other trace components is recovered in the distillate. The feed is below the boiling point, so that $q=1.10$. The operating reflux ratio is 3.0. Assume Raoult's Law applies.

Determine the following:

- Composition and amounts of the distillate and bottoms streams for a feed of 100 mole/hr.
- Top and bottom temperatures and the number of stages at total reflux.
- The distribution of components at the conditions determined in part (b).
- The minimum reflux ratio, and number of stages when $R=3.0$.
- The feed tray location.

Multicomponent Fractional Distillation Calculation Validation Continued

$$N_m = \log \left[\frac{0.95(27.778) + 0.05(27.778)}{0.05(27.778) + 0.95(27.778)} \right] = 9.21 \text{ theoretical stages}$$

Distribution of trace components C + D in Dist. Bottom

$$\frac{X_{CD}}{X_{DW}} = \left(\alpha_{CD} \right)^{N_m} \frac{X_{HD}}{X_{HW}}$$

Component C $\alpha_{C,av} = \sqrt{0.429 \times 0.4891} = 0.4581$

$$\frac{X_{CD}}{X_{DW}} = (0.4581)^{9.21} \left(\frac{0.05 \times 27.778}{0.2577 \times 72.222} \right) = 5.628 \times 10^{-5}$$

Mate. bal. of C $X_{CF} = X_{CD} + X_{CW}$, $15.00 = 5.628 \times 10^{-5} X_{CW} + 1.0 X_{CW}$

Solving, $X_{CW} = 14.999155$, $X_{CD} = 0.000845 = 8.45 \times 10^{-4}$

Component D $\alpha_{D,av} = \sqrt{0.1778 \times 0.2210} = 0.1982$

$$\frac{X_{DD}}{X_{DW}} = (0.1982)^{9.21} \left(\frac{0.05 \times 27.778}{0.2577 \times 72.222} \right) = 2.51 \times 10^{-8}$$

Mate. bal. of D $X_{DF} = X_{DD} + X_{DW}$, $35.0 = X_{DD} + \frac{X_{DD}}{2.51 \times 10^{-8}}$

Solving, $X_{DD} = 8.79 \times 10^{-7}$, $X_{DW} = 35.00$

$$Eq. (11.7-19) \quad 1 - q = \frac{\sum \alpha_i X_{iF}}{\alpha_i - \theta} \quad \text{trial and error.}$$

$$1 - 1 = -0.100 = \frac{1.649 \times 0.30}{1.649 - \theta} + \frac{1.000 \times 0.20}{1.000 - \theta} + \frac{0.463 \times 0.15}{0.463 - \theta} + \frac{0.2022 \times 0.35}{0.2022 - \theta}$$

$$\text{Assumed } \theta = \frac{0.4947}{1.649 - \theta} + \frac{0.2000}{1.000 - \theta} + \frac{0.0699}{0.463 - \theta} + \frac{0.0711}{0.2022 - \theta}$$

| | | | | | |

Hence, use $\theta = 1.1955$

$$R_m + 1 = \frac{\sum \alpha_i X_{iD}}{\alpha_i - \theta}$$

$$R_m + 1 = \frac{1.649 \times 0.95}{1.649 - 1.1955} + \frac{1.000 \times 0.05}{1.000 - 1.1955} + \frac{0.463(3.04 \times 10^{-5})}{0.463 - 1.1955} + \frac{0.2022(3.16 \times 10^{-8})}{0.2022 - 1.1955}$$

$$R_m = 2.199 \quad R_m \approx 2.20$$

Use operating $R = 3.00$

$$\frac{R}{R+1} = \frac{3}{3+1} = 0.75 \quad \frac{R_m}{R_m+1} = \frac{2.20}{2.20+1} = 0.6875$$

$$N_m / N = 0.57 \quad 9.21 / N = 0.57$$

$$N = 16.2 \text{ theoretical stages}$$
